

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently amended) A shaving apparatus comprising:

at least one shaving head including a shaving surface for contacting the skin during shaving and at least one cutter that is moveable behind the shaving surface;

a drive structure including a motor coupled to the at least one cutter for driving the movement of the at least one cutter;

electric power supply means connected to the motor;

a housing containing the motor and at least part of the electric power supply means and carrying the drive structure;

a shell structure enveloping at least a circumference of the housing behind the at least one shaving head when mounted to the housing; and

a shaving head holder support carrying a shaving head holder to which the at least one shaving head is mounted, wherein the shell extends at least from a face against which the at least one shaving head holder support is mounted to a power plug socket at an

end of the housing opposite from the face against which the at least one shaving head holder support is mounted, wherein the shell structure fully envelopes the housing at least between the face against which the at least one shaving head holder support is mounted and the power plug socket, and wherein the housing extends at least from the face against which the at least one shaving head holder support is mounted to the power plug socket fully enclosing a space between the face and the power plug socket.

2. (Canceled)

3. (Canceled)

4. (Previously presented) The shaving apparatus according to claim 1, wherein the shell structure includes shell portions spaced from the housing such that an interspace is left between the housing and said shell portions.

5. (Previously presented) The shaving apparatus according to claim 4, further comprising at least one draining passage for draining the interspace between the housing and the shell structure.

6. (Previously presented) The shaving apparatus according to claim 1, wherein at least a portion of the shell structure is of a more impact resistant material than the housing.

7. (Previously presented) The shaving apparatus according to claim 1, wherein at least a portion of the shell structure is of a softer material than the housing.

8. (Previously presented) The shaving apparatus according to claim 1, wherein the housing includes at least a first operating member and wherein the shell structure includes at least a second operating member operatively connected with said first operating member.

9. (Previously presented) The shaving apparatus according to claim 8, wherein said second operating member is mechanically connected with said first operating member.

10. (Previously presented) The shaving apparatus according to claim 8, wherein said second operating member is electrically connected with said first operating member.

11. (Previously presented) The shaving apparatus according to claim 1, further comprising an optical signaling member, said shell structure including a window via which optical signals generated by said optical signaling member are visible.

12. (Previously presented) The shaving apparatus according to claim 1, wherein the shell structure is detachable from the housing.

13. (Previously presented) An assortment of at least two shaving apparatuses, each according to claim 1, wherein said housings of at least two of said apparatuses have mutually identical shapes and wherein at least portions of two of said shell structures of said at least two apparatuses that cover mutually corresponding portions of the housings of said at least two apparatuses have mutually different shapes.

14. (Previously presented) An assortment comprising at least one shaving apparatus according to claim 1 and at least two of said shell structures, wherein said shell structures are each mountable to said housing as an alternative for the other one of said shell structures and wherein at least portions of two of said shell structures that, when in mounted condition, cover the same portions of said housing have mutually different shapes.

15. (Currently amended) A method of manufacturing a shaving apparatus, ~~apparatuses~~, each comprising at least one shaving head including a shaving surface for contacting the skin during shaving and at least one cutter moveable behind the shaving surface; a drive structure including a motor and coupled to the at least one cutter for driving movement of the at least one cutter; electric power supply means connected to the motor; the method comprising acts of:

~~manufacturing, for each of said shaving apparatuses,~~ a housing containing the motor and at least part of the electric power supply means and carrying the drive structure, ~~said housings being identical to each other;~~ and

~~manufacturing, for each of said shaving apparatuses, a shell~~
structure mostly enveloping the housing behind the at least one
shaving head up to a power plug socket when mounted to the housing,
~~said shell structure consisting of two shell portions having shapes~~
~~different from each other, wherein the shell portions are structure~~
is spaced from the housing such that an interspace is left between
the housing and said shell portionsstructure, wherein the act of
manufacturing the housing comprises an act of manufacturing the
housing to extend at least from the face against which the at least
one shaving head holder support is mounted to the power plug socket
fully enclosing a space between the face and the power plug socket.

16. (New) The method according to claim 15, further comprising
an act of manufacturing at least one draining passage for draining
the interspace between the housing and the shell structure.

17. (New) A shaving apparatus comprising:

at least one shaving head including a shaving surface for
contacting the skin during shaving and at least one cutter that is
moveable behind the shaving surface;

a drive structure including a motor coupled to the at least one cutter for driving the movement of the at least one cutter;

electric power supply means connected to the motor;

a housing containing the motor and at least part of the electric power supply means and carrying the drive structure;

a shell structure enveloping at least a circumference of the housing behind the at least one shaving head when mounted to the housing;

at least one draining passage; and

a shaving head holder support carrying a shaving head holder to which the at least one shaving head is mounted, wherein the shell extends at least from a face against which the at least one shaving head holder support is mounted to a power plug socket at an end of the housing opposite from the face against which the at least one shaving head holder support is mounted, wherein the shell structure fully envelopes the housing at least between the face against which the at least one shaving head holder support is mounted and the power plug socket, wherein the shell structure includes shell portions spaced from the housing such that an interspace is left between the housing and said shell portions and

wherein the at least one draining passage is arranged for draining the interspace between the housing and the shell structure.

18. (New) The shaving apparatus according to claim 1, wherein the electric power supply means includes a battery and wherein the housing fully encloses the battery between the face and the power plug socket.

19. (New) The shaving apparatus according to claim 1, wherein the electric power supply means includes a battery and wherein the housing fully encloses the battery and the motor between the face and the power plug socket.

20. (New) The shaving apparatus according to claim 1, wherein the electric power supply means includes a battery and control circuitry and wherein the housing fully encloses the battery and the control circuitry between the face and the power plug socket.

21. (New) The shaving apparatus according to claim 1, wherein the housing is waterproof between the face and the power plug socket such that water can not enter the space.

22. (New) The method according to claim 15, wherein the electric power supply means includes a battery and wherein the act of manufacturing the housing comprises an act of manufacturing the housing to fully enclose the battery between the face and the power plug socket.

23. (New) The method according to claim 15, wherein the act of manufacturing the housing comprises an act of manufacturing the housing to be waterproof between the face and the power plug socket such that water can not enter the space.
